

Final Projects

Project proposal ideas and hints (<http://cs107e.github.io/project/>)

Form project teams NOW - 1-3 people (2 best)

Google form due 11:59 pm Thursday November 18th

- Include teammates for shared git repo
- Includes short project proposal

Two labs

- 1st - refine project ideas and solid milestones
- 2nd - finish milestones and final push

Class demos (12:15pm Thurs Dec 9)

Final code and writeup submission (due Noon on Thursday, Dec. 9th)

\$20 parts budget per person; need to submit receipts

Assignments / Extensions

After some consideration, we are extending the final assignments and extensions deadline from the original Assignment 7 due date to *Tuesday, November 23rd*. This is during Thanksgiving break, but before Thanksgiving itself. :) Assignment 7 is still due on the normal date.

CR/NC Deadline

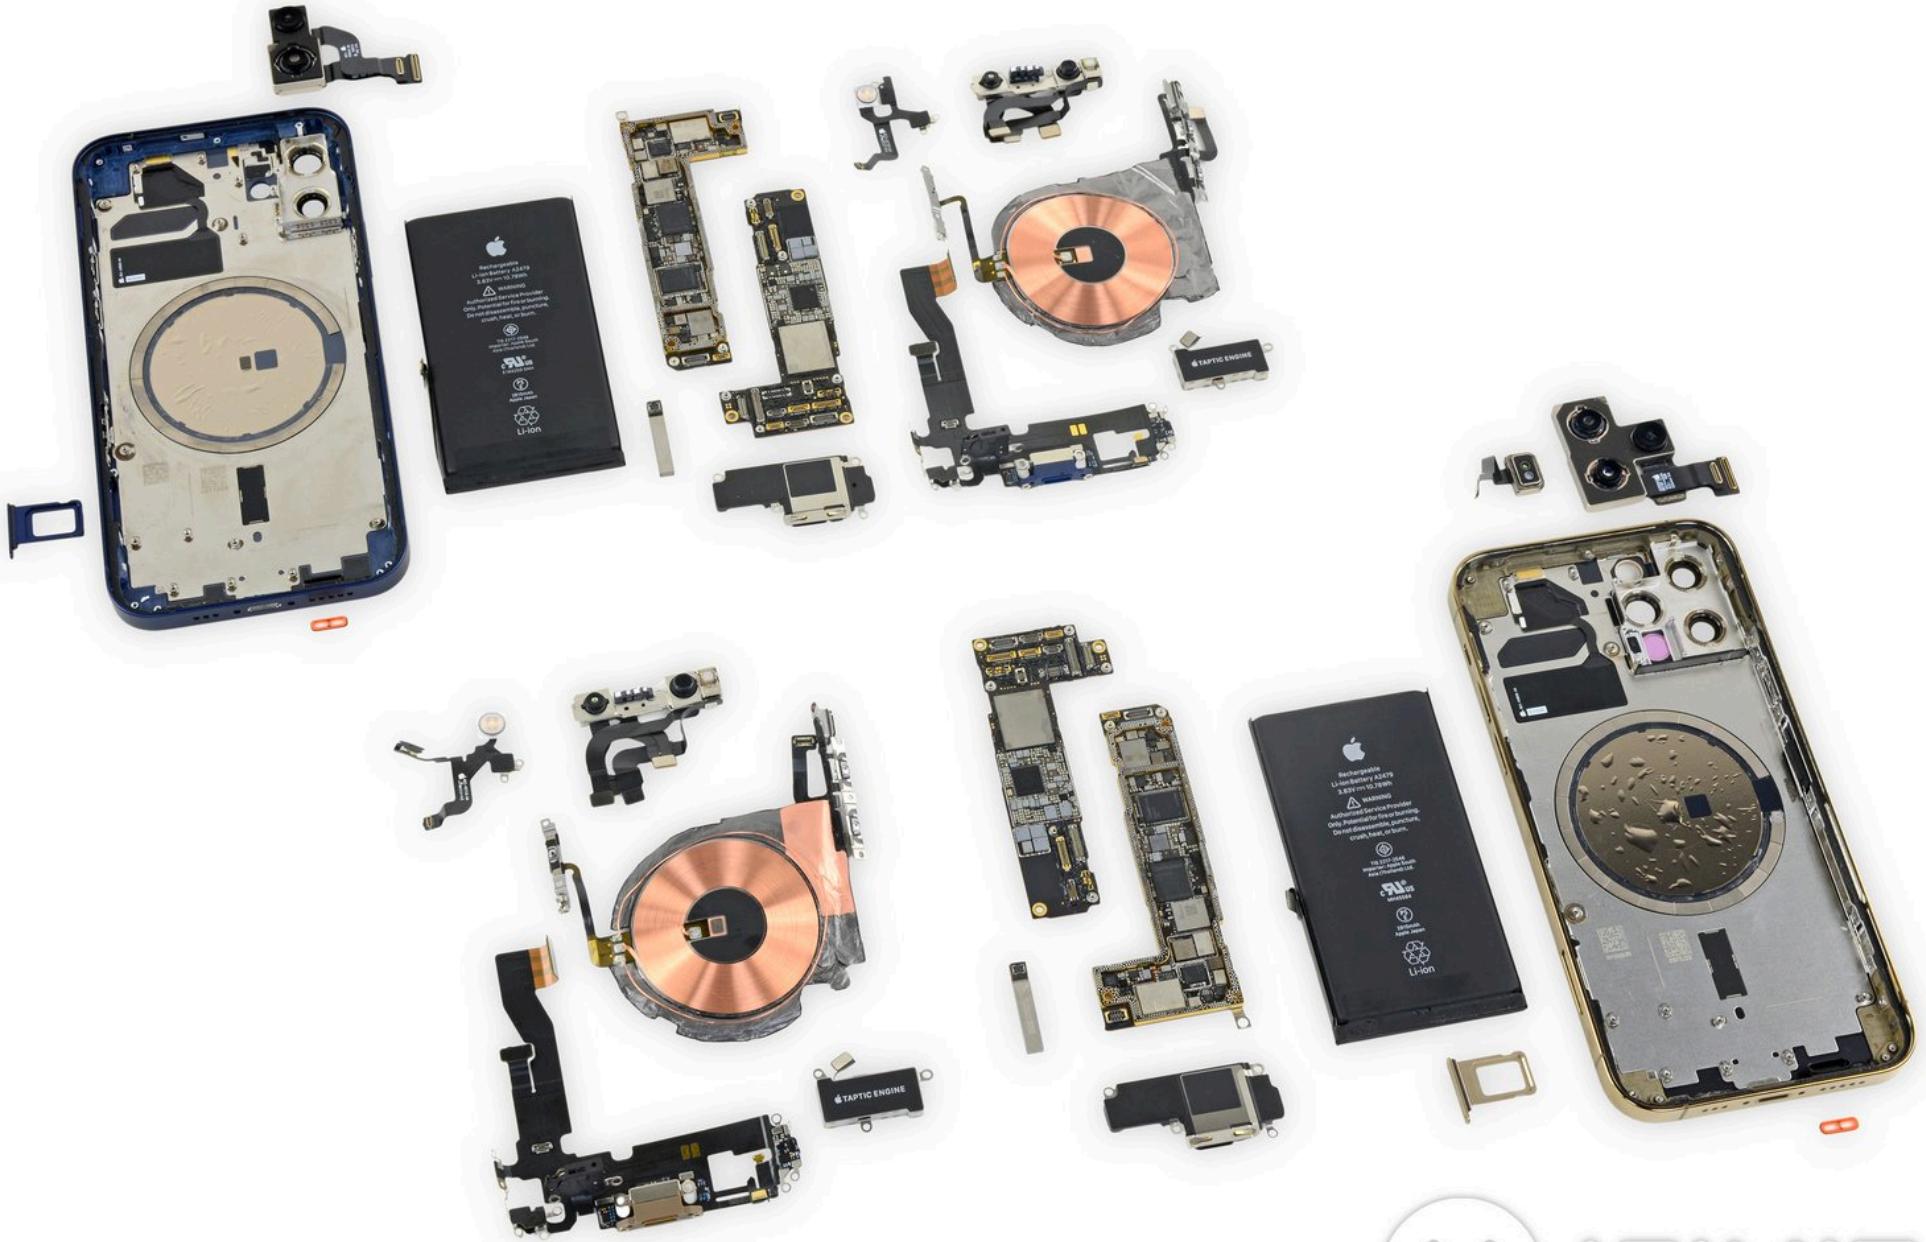

In order to pass the course:

- You must pass 80% of the P1 tests for the assignments.
- You must pass the final project.

CS107e

Sensors

Apple iPhone 12 Teardown

How many sensors?

Apple iPhone 12

How many sensors?

3 12MP Ultra wide, wide,, and telephoto cameras

LIDAR TrueDepth camera

12MP front TrueDepth camera with FaceID

HapticTouch multi-touch vibrating display

Microphones (2 at top, 2 at bottom)

Proximity sensor

Ambient light sensor

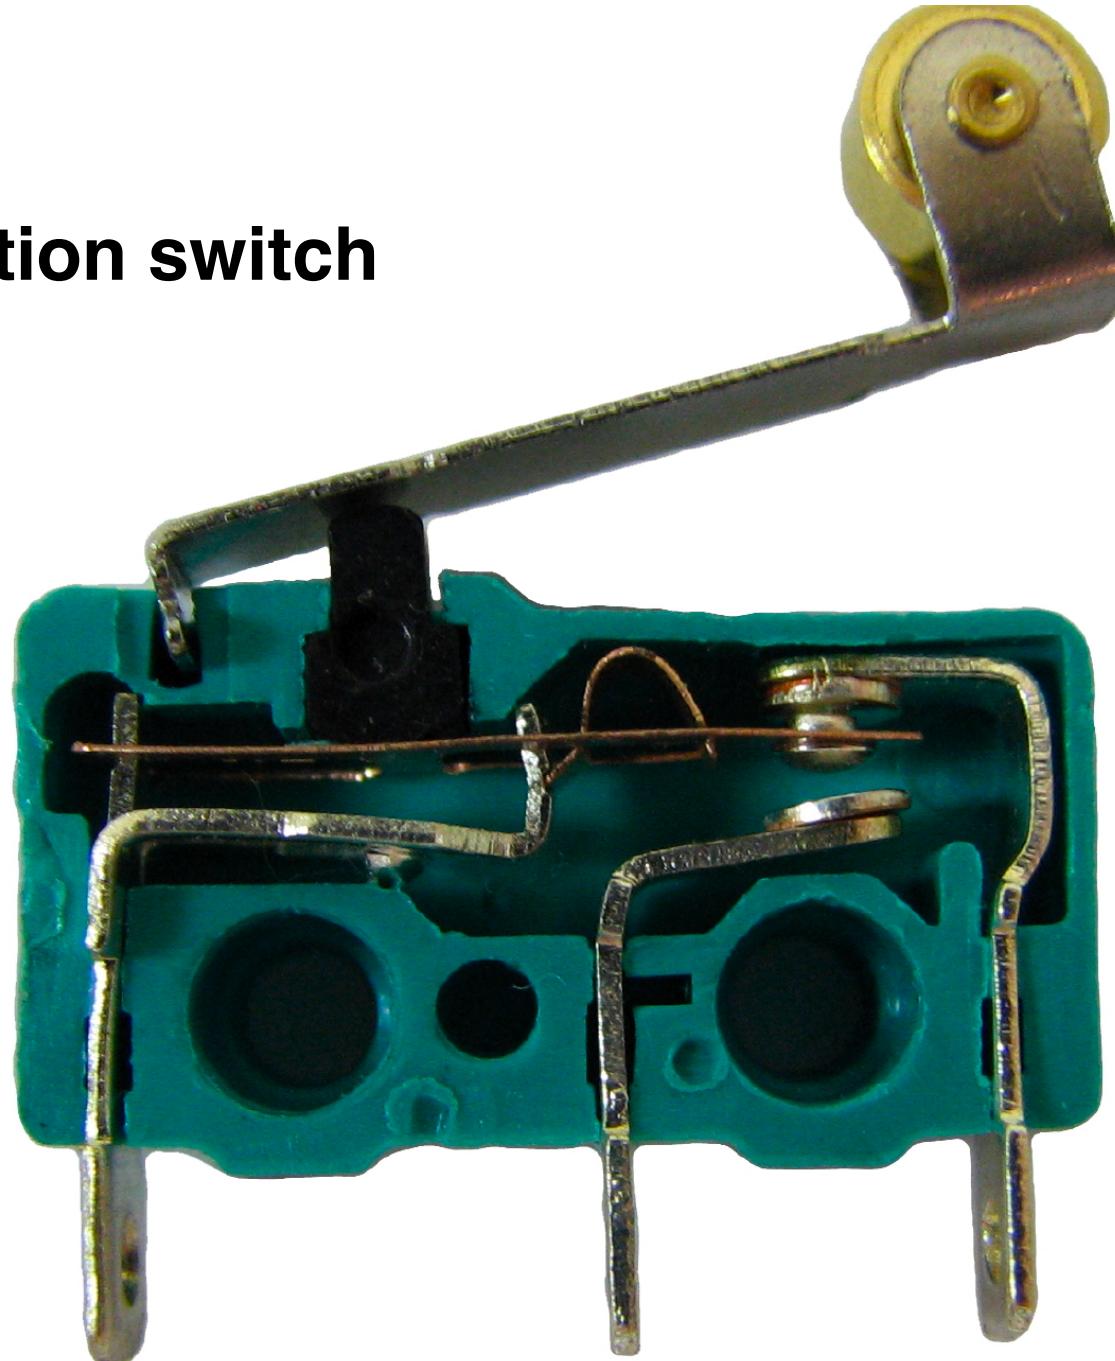

Accelerometer

Gyroscope

Compass (magnetometer)

Barometer (altimeter)

Snap-action switch

Common

NO

NC

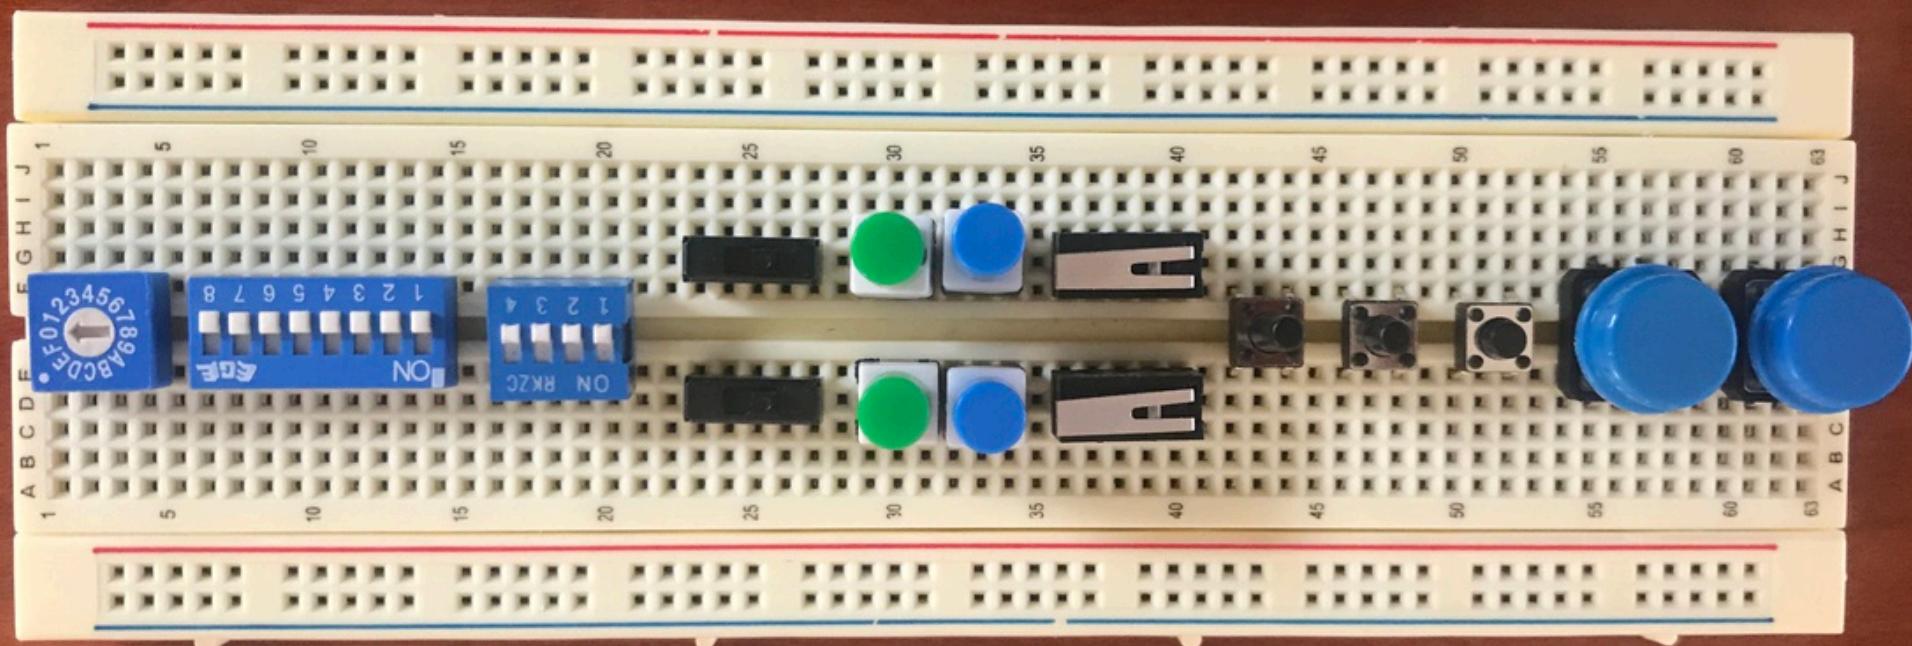

Happ Pushbutton

Happ Joystick

Buttons and Switches

Rotary Encoder

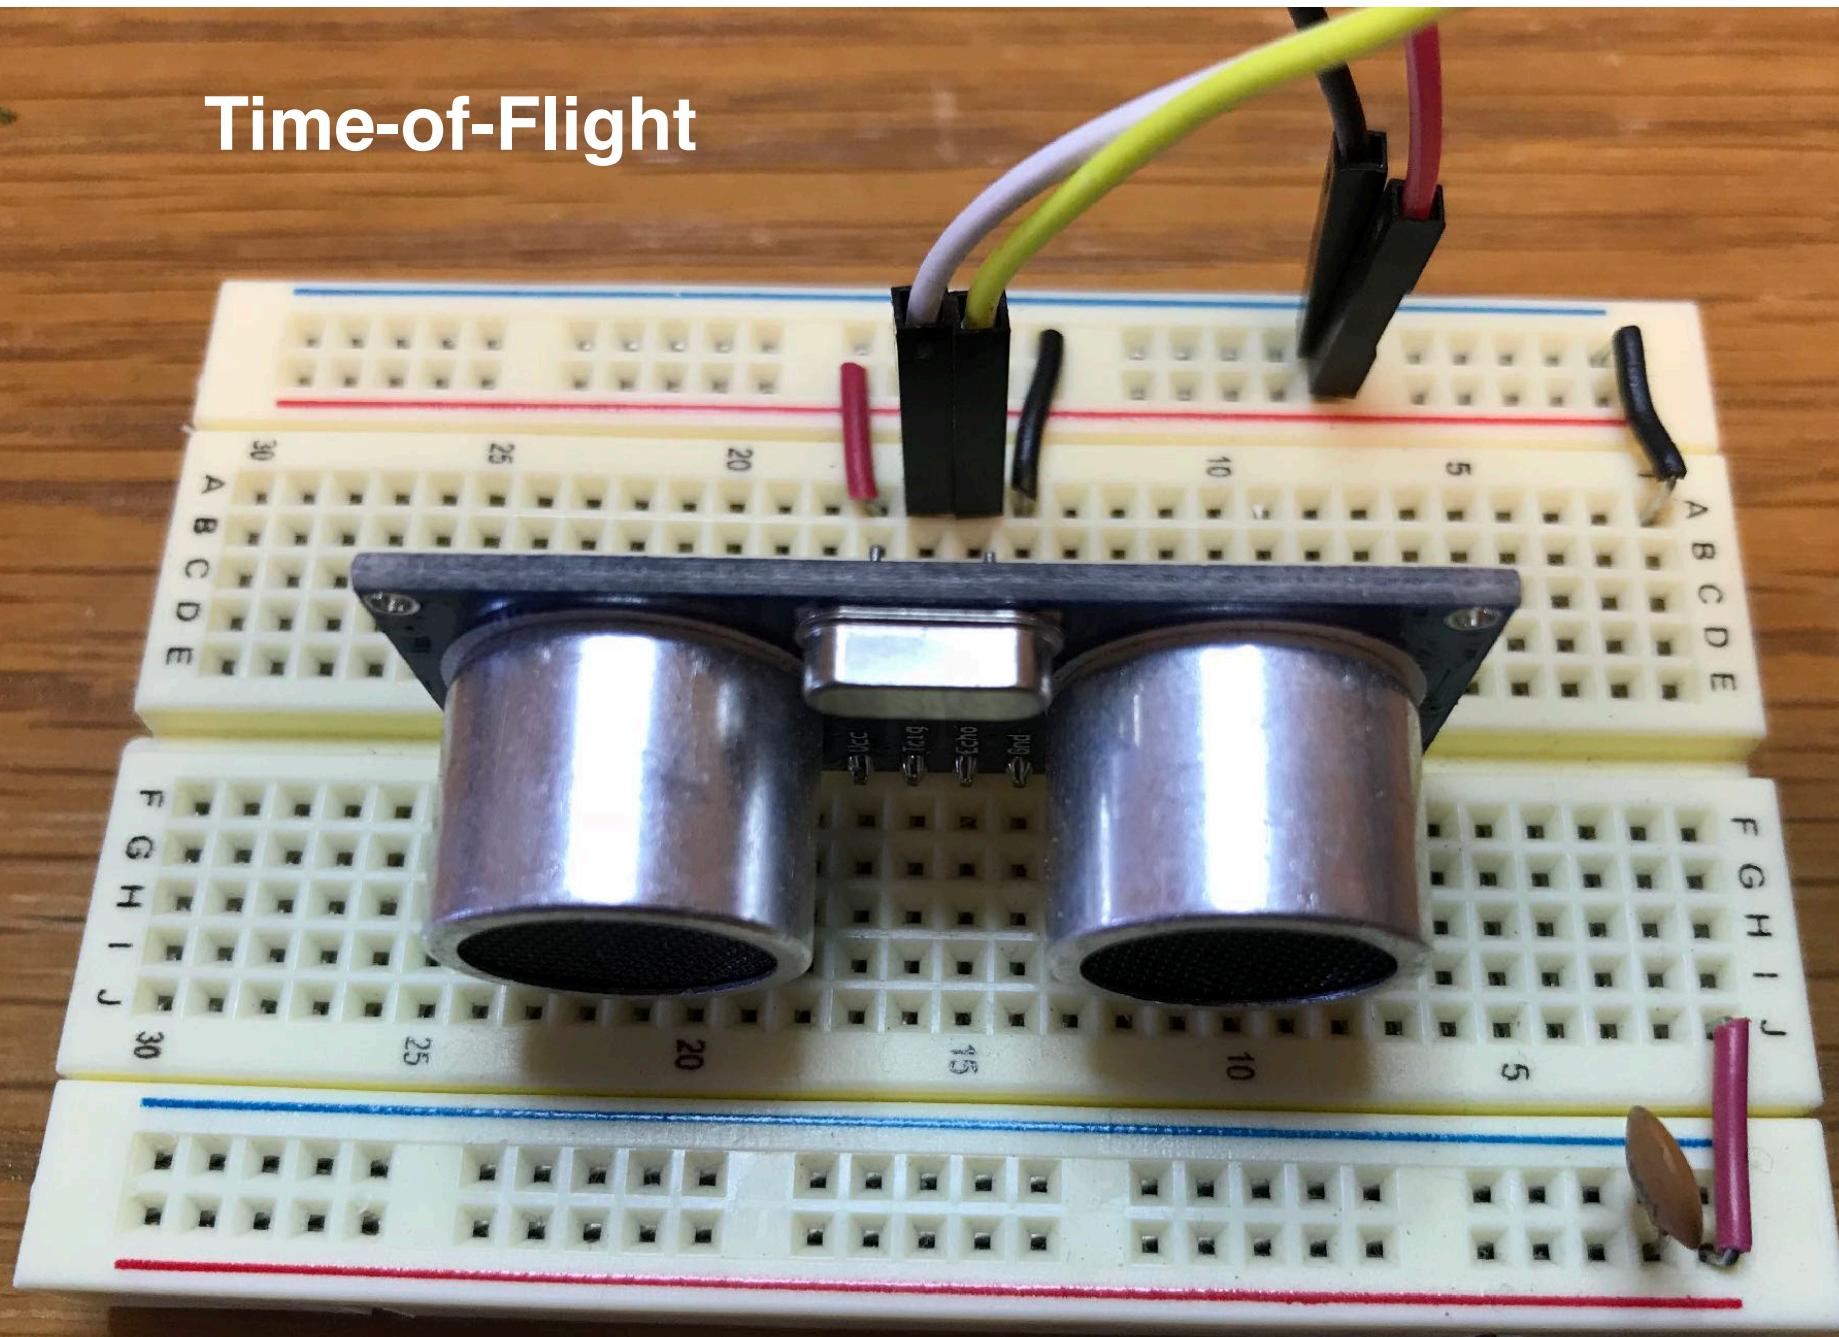

- A rotary encoder has a knob that turns, and "clicks" after small rotations.
- You can programmatically determine which direction the rotation occurred
- Pushing down on the knob clicks a button
- <https://lastminuteengineers.com/rotary-encoder-arduino-tutorial/>

Data Sheet and example code:

Rotary%20Encoder.pdf](https://www.handsontec.com/dataspecs/module/Rotary%20Encoder.pdf)

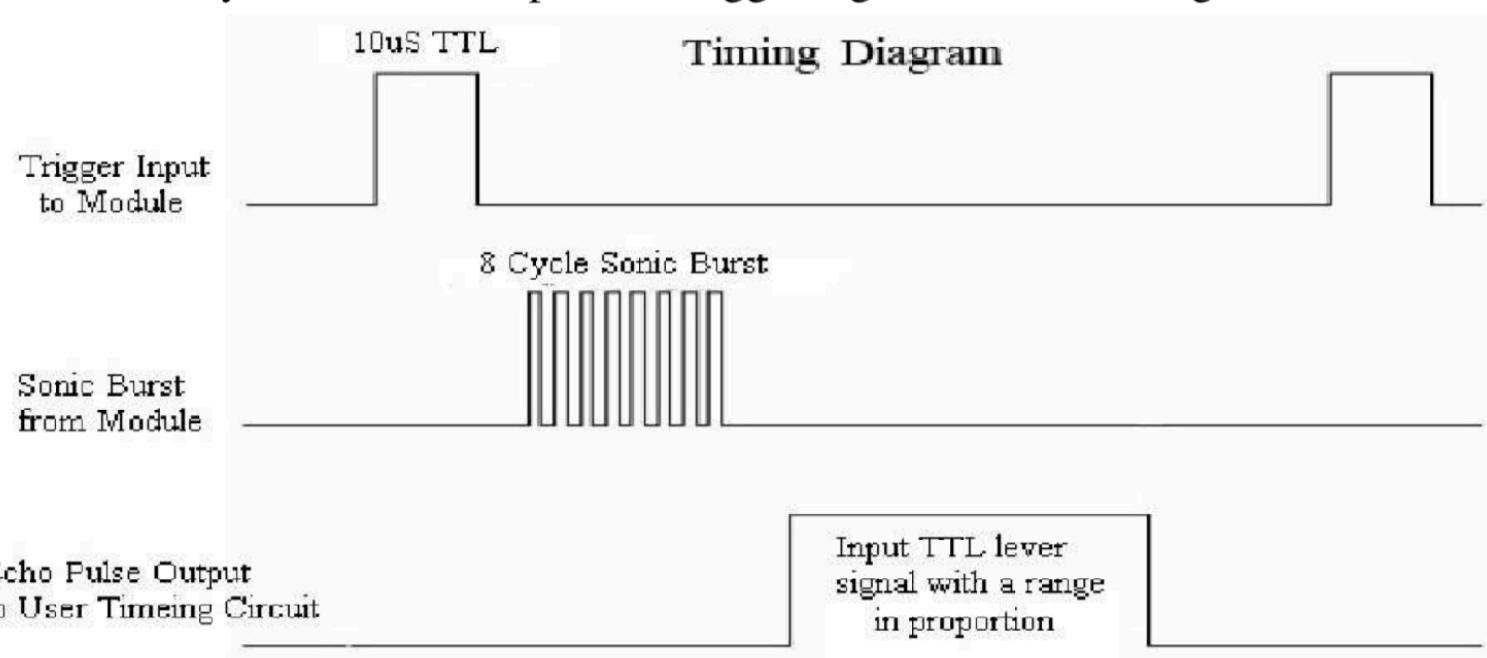

Time-of-Flight

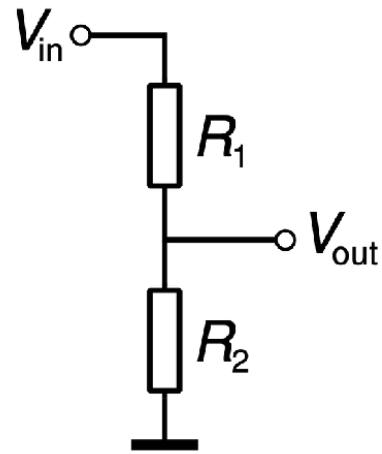

HC04 Ultrasonic Sonar

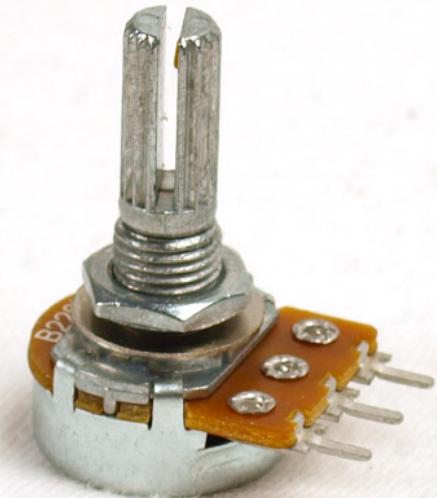

The Timing diagram is shown below. You only need to supply a short 10uS pulse to the trigger input to start the ranging, and then the module will send out an 8 cycle burst of ultrasound at 40 kHz and raise its echo. The Echo is a distance object that is pulse width and the range in proportion .You can calculate the range through the time interval between sending trigger signal and receiving echo signal. Formula: $uS / 58 = \text{centimeters}$ or $uS / 148 = \text{inch}$; or: the range = high level time * velocity (340M/S) / 2; we suggest to use over 60ms measurement cycle, in order to prevent trigger signal to the echo signal.

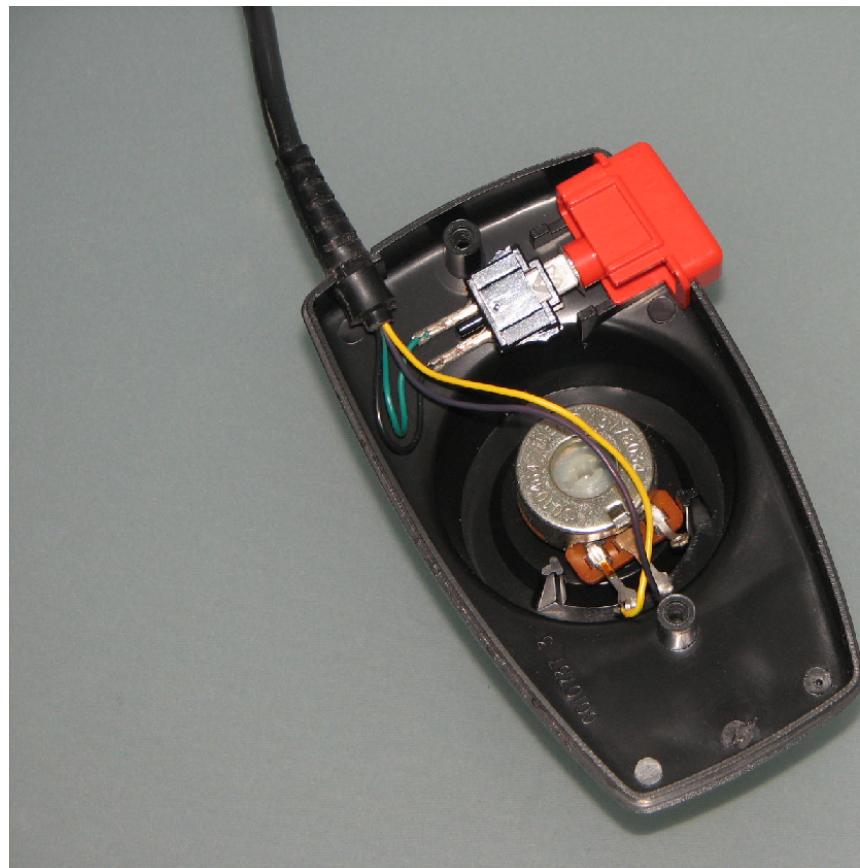

Analog to Digital (ADC)

$$V_{out} = \frac{R_2}{R_1 + R_2} V_{in}$$

**Potentiometer
(Voltage divider)**

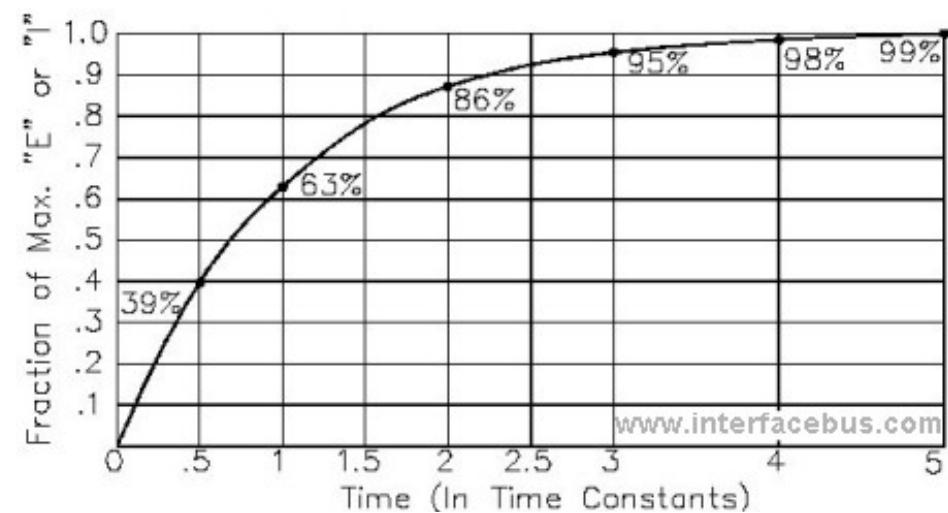

GPIO Input = Comparator

Charging Circuit

The time to fire depends on the input signal voltage

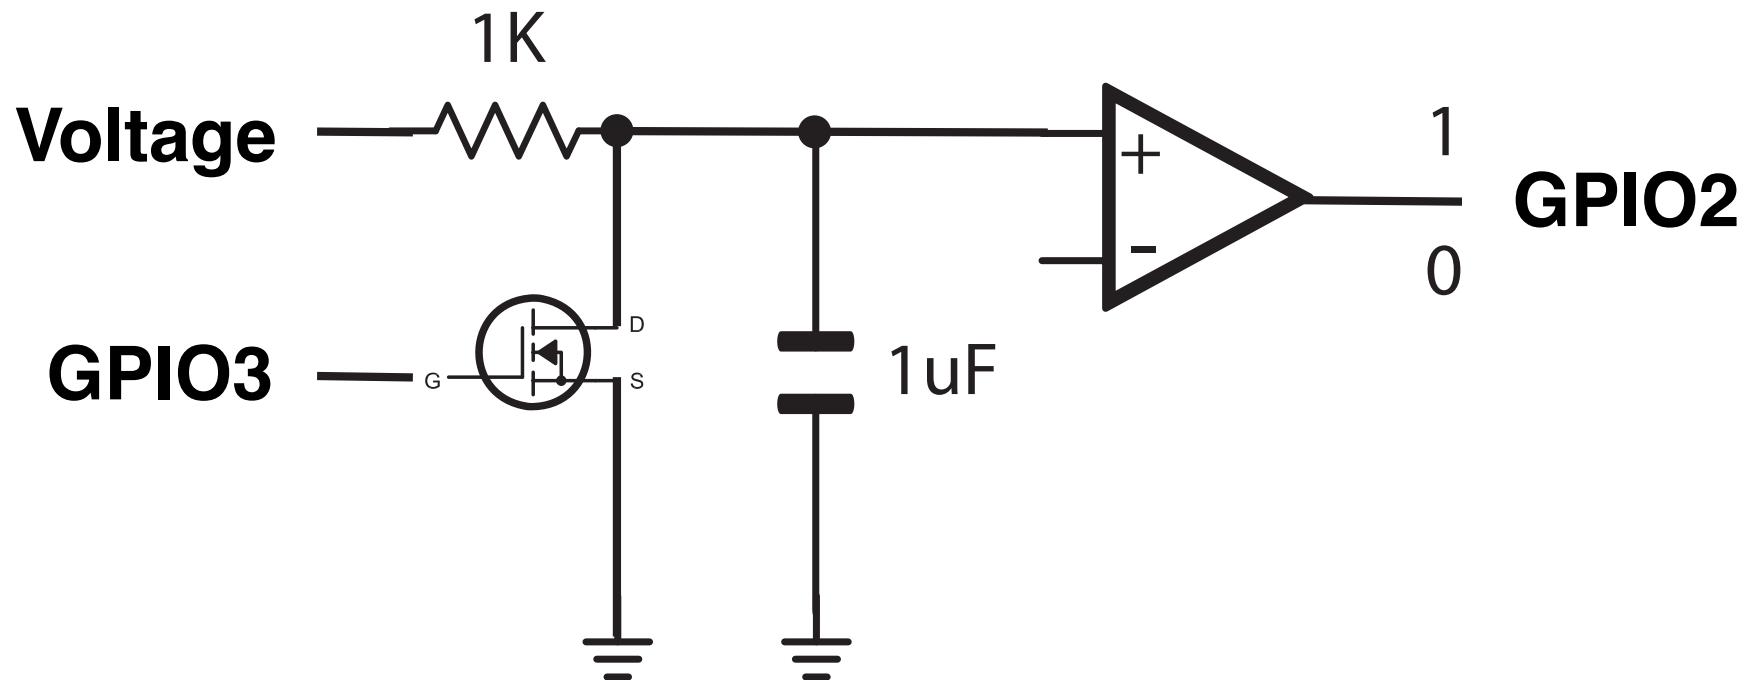

$$RC = 10^3 \times 10^{-6} = 1000 \mu\text{secs}$$

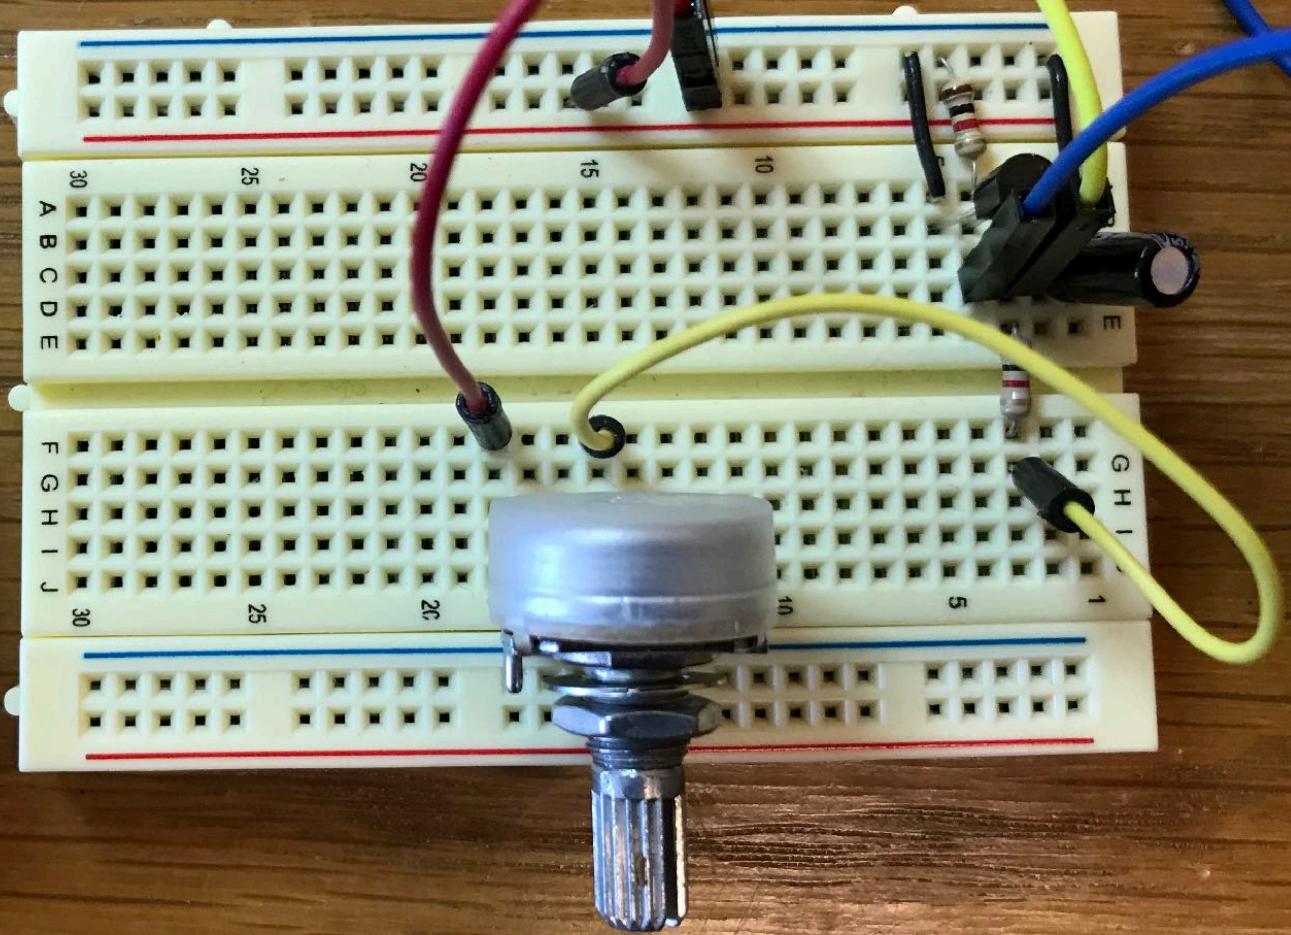

ADC

1. Turn on transistor, discharge capacitor
2. Turn off transistor, charge capacitor

RC = 1000 usecs

joystick

How do we figure out how to use it?

We find the part number (often written on the part), and we read the data sheet!

joystick

How do we figure out how to use it?

We find the part number (often written on the part), and we read the data sheet!

**Uh-oh. This part doesn't have a number.
So...we Google the pins.**

joystick

Specifications

	Joystick Module
Switch Protocol	Digital
X,Y Protocol	Analog
Operating Voltage	3VDC - 5VDC
Dimensions	47(L) x 25(W) x 32(H)

Pinout

Module	Duinotech	Function
GND	GND	Ground Connection
+5V	5V	Power
VRX	A0	X Output
VRY	A1	Y Output
SW	D7	Push Button Output

joystick

Specifications

	Joystick Module
Switch Protocol	Digital
X,Y Protocol	Analog
Operating Voltage	3VDC - 5VDC
Dimensions	47(L) x 25(W) x 32(H)

**Here we go again with
an analog circuit!**

Pinout

Module	Duinotech	Function
GND	GND	Ground Connection
+5V	5V	Power
VRX	A0	X Output
VRY	A1	Y Output
SW	D7	Push Button Output

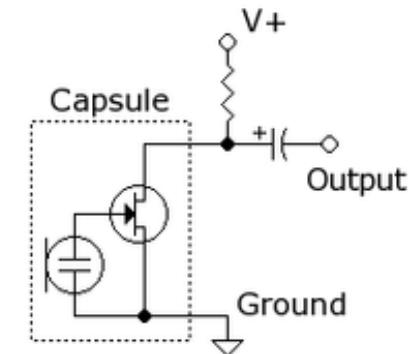

The Raspberry Pi GPIO pins are all digital, but this joystick is analog!

We can use our code from the potentiometer demo!

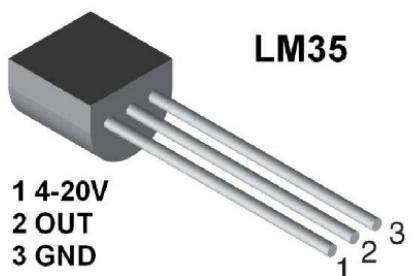

Analog Sensors

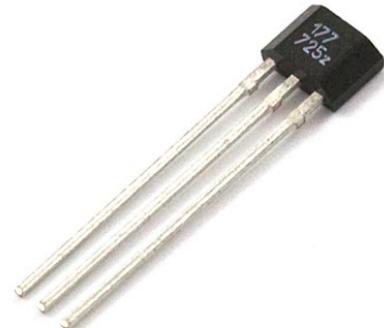

**Phototransistor
(light)**

**Electret Microphone
(pressure)**

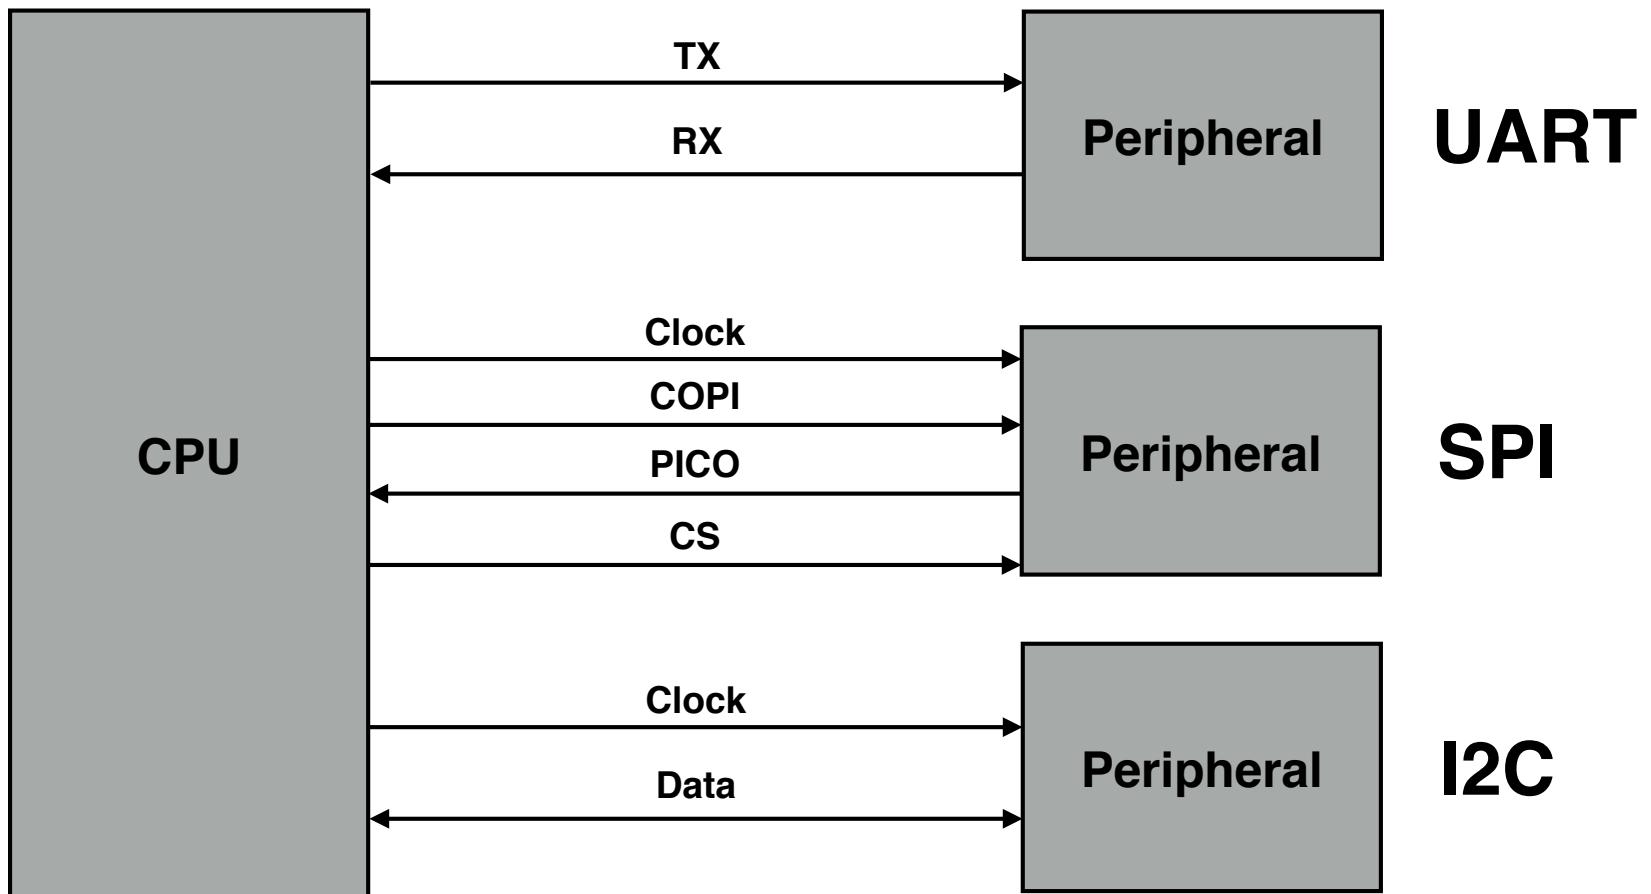

(temperature)

**Analog Hall Effect
(magnetic field)**

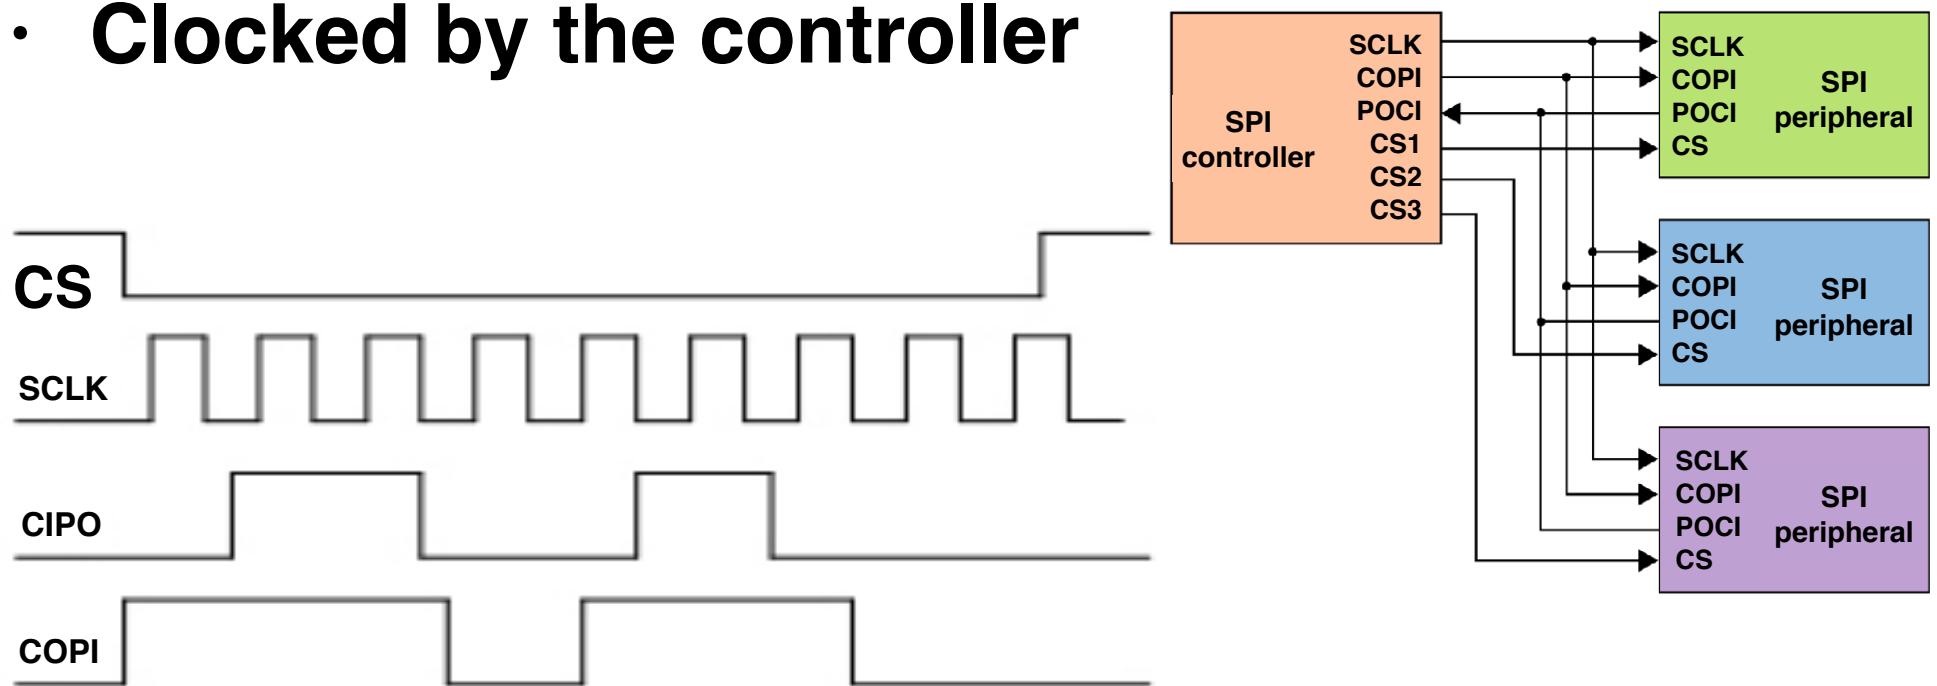

Smart Sensors

Bus Protocols

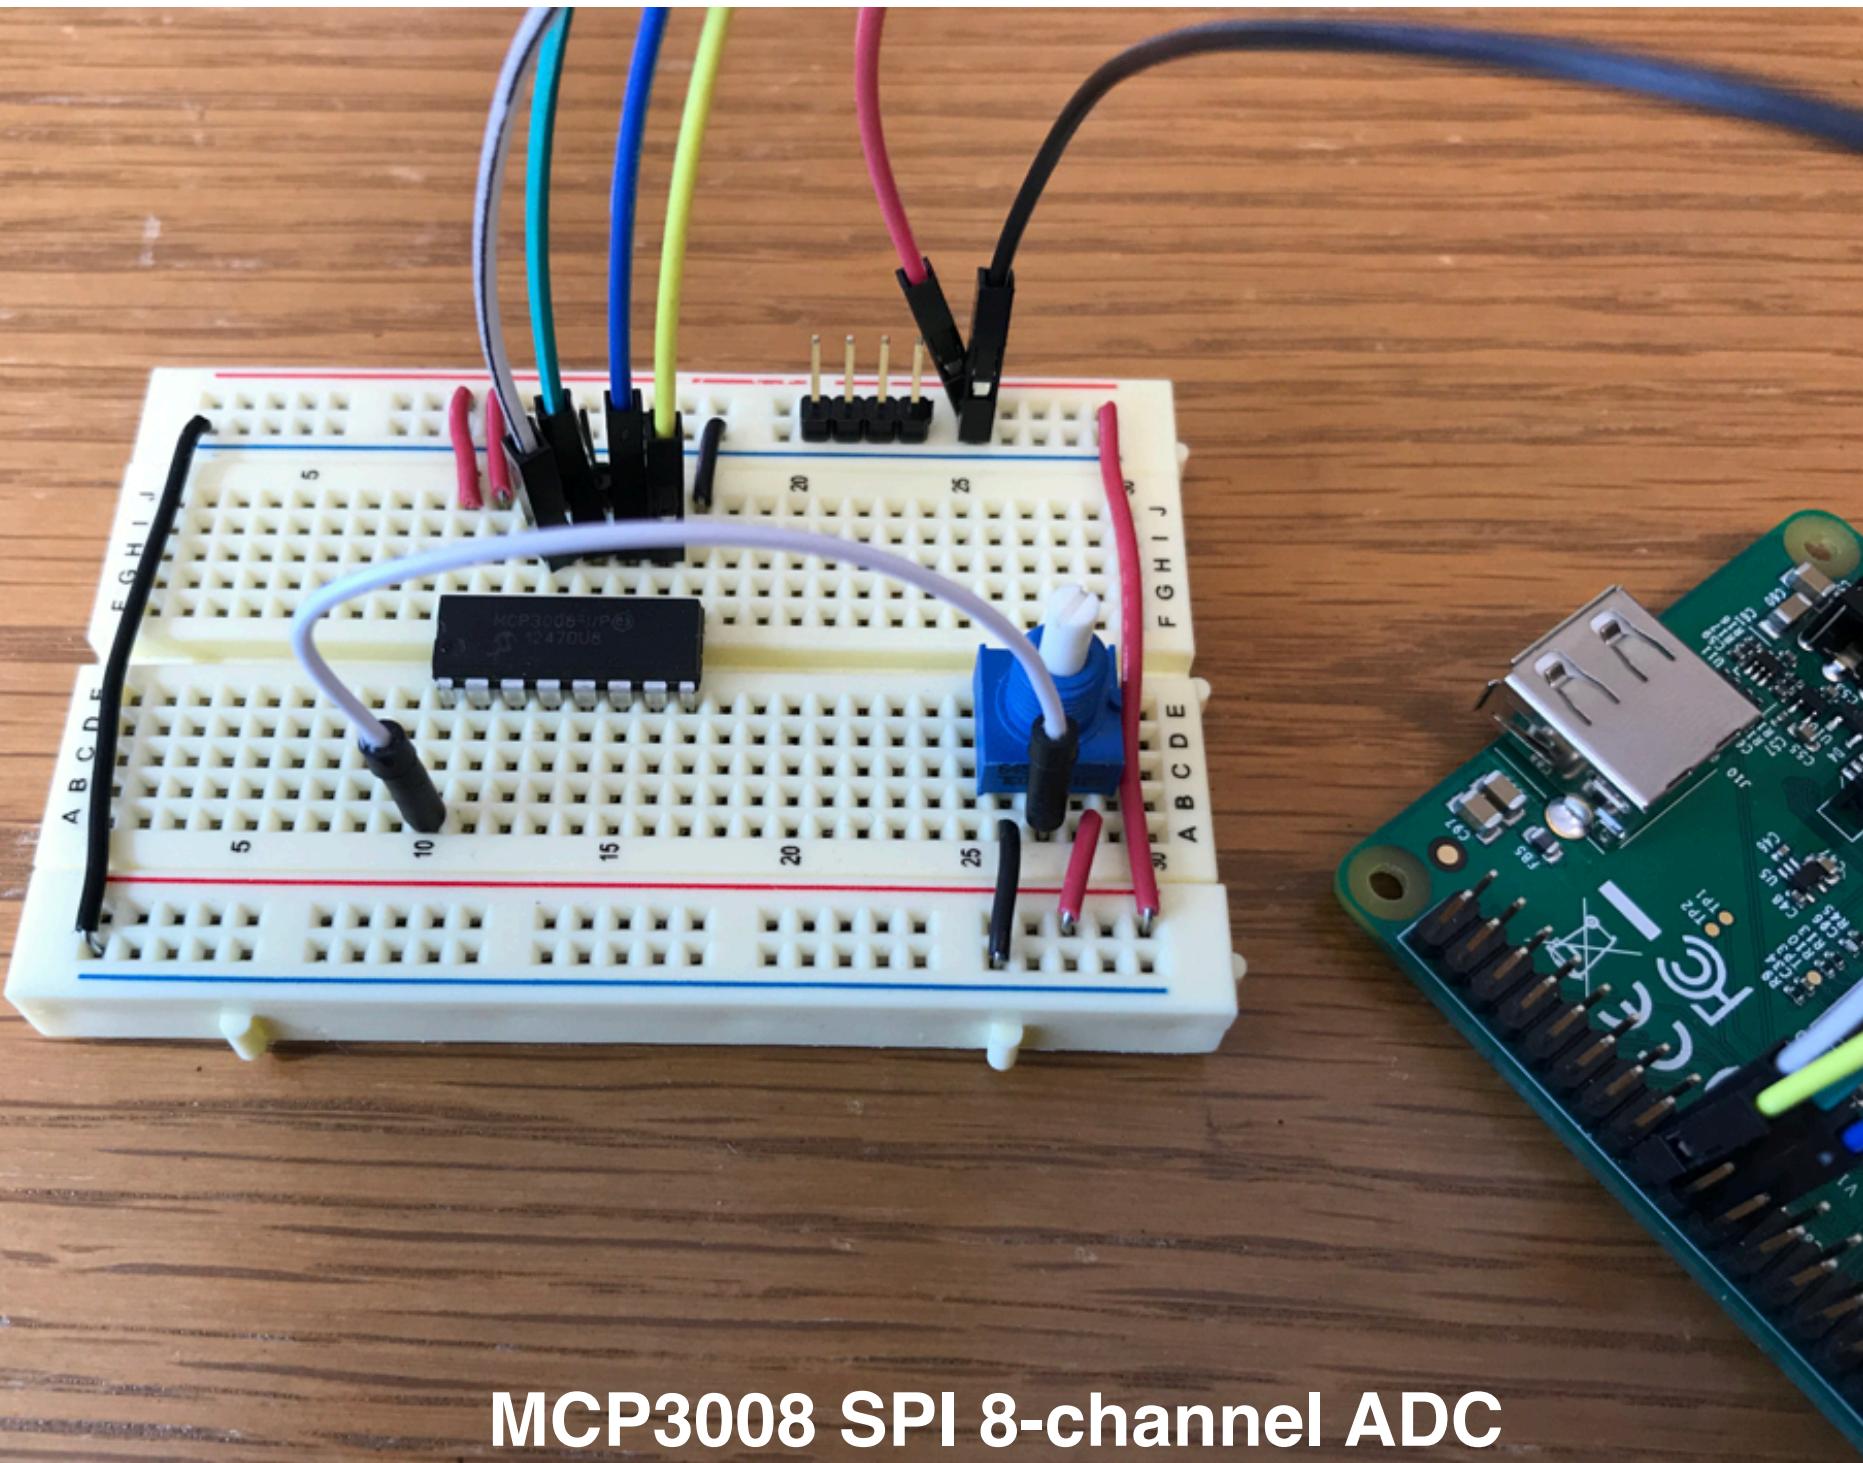

SPI

- Shared CLK, COPI, POCl lines
- Active low chip select (CS) lines to specify which peripheral is active
- Clocked by the controller

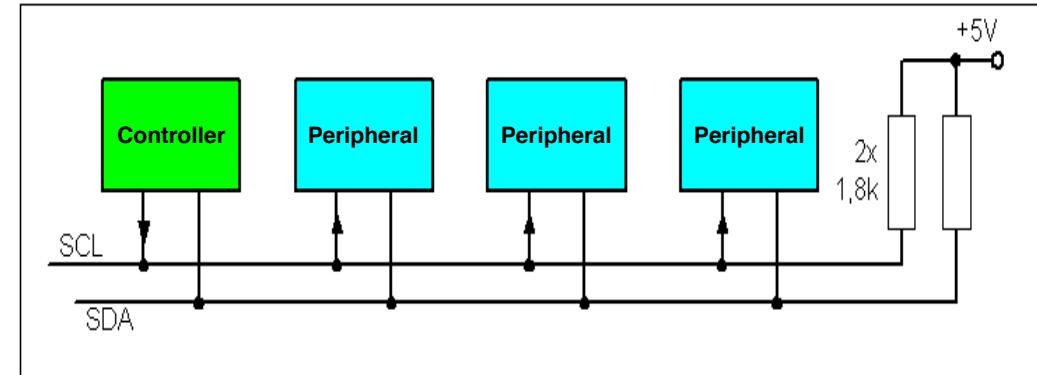

Figures from https://upload.wikimedia.org/wikipedia/commons/thumb/f/fc/SPI_three_slaves.svg/2000px-SPI_three_slaves.svg.png (top), <http://www.tequipment.net/RigoISD-SPI-DS4.html> (bottom)

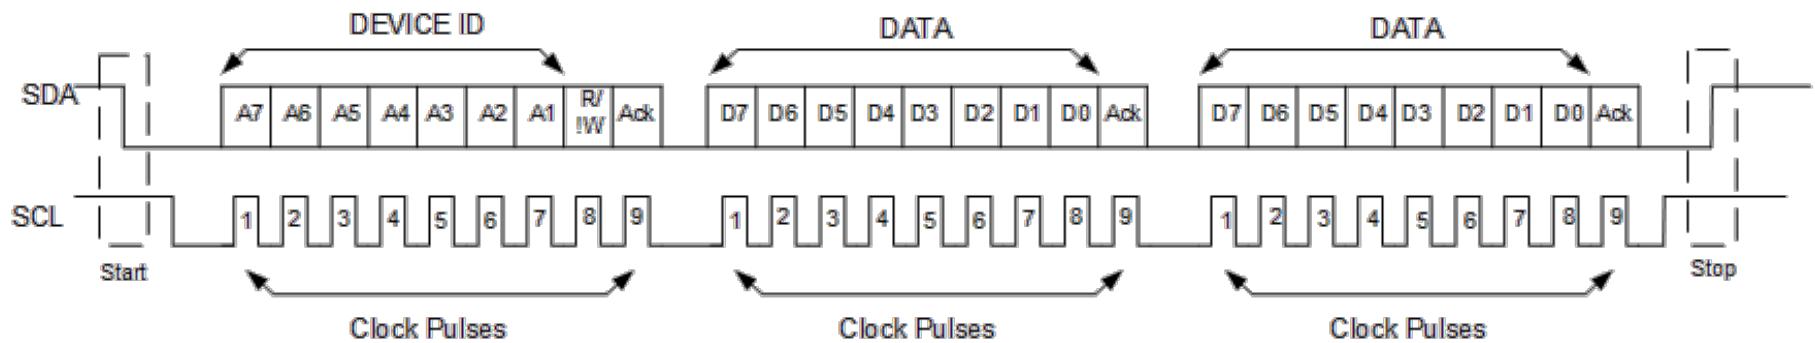

MCP3008 SPI 8-channel ADC

I2C

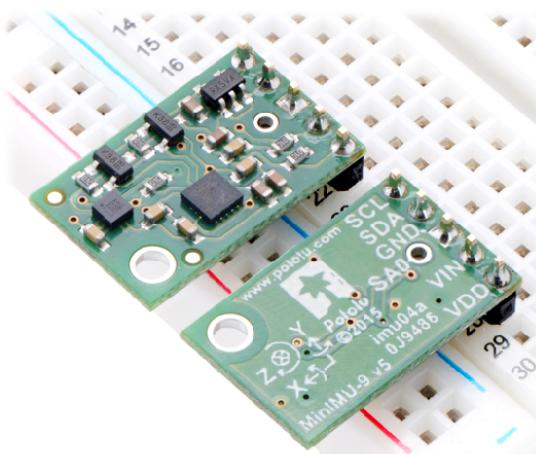

- CLK & DATA lines (with pull-ups)
- Clocked by controller, both controller and peripheral send data
- Shared bus, peripheral identified by 7 (or 10) bit address

Pressure**

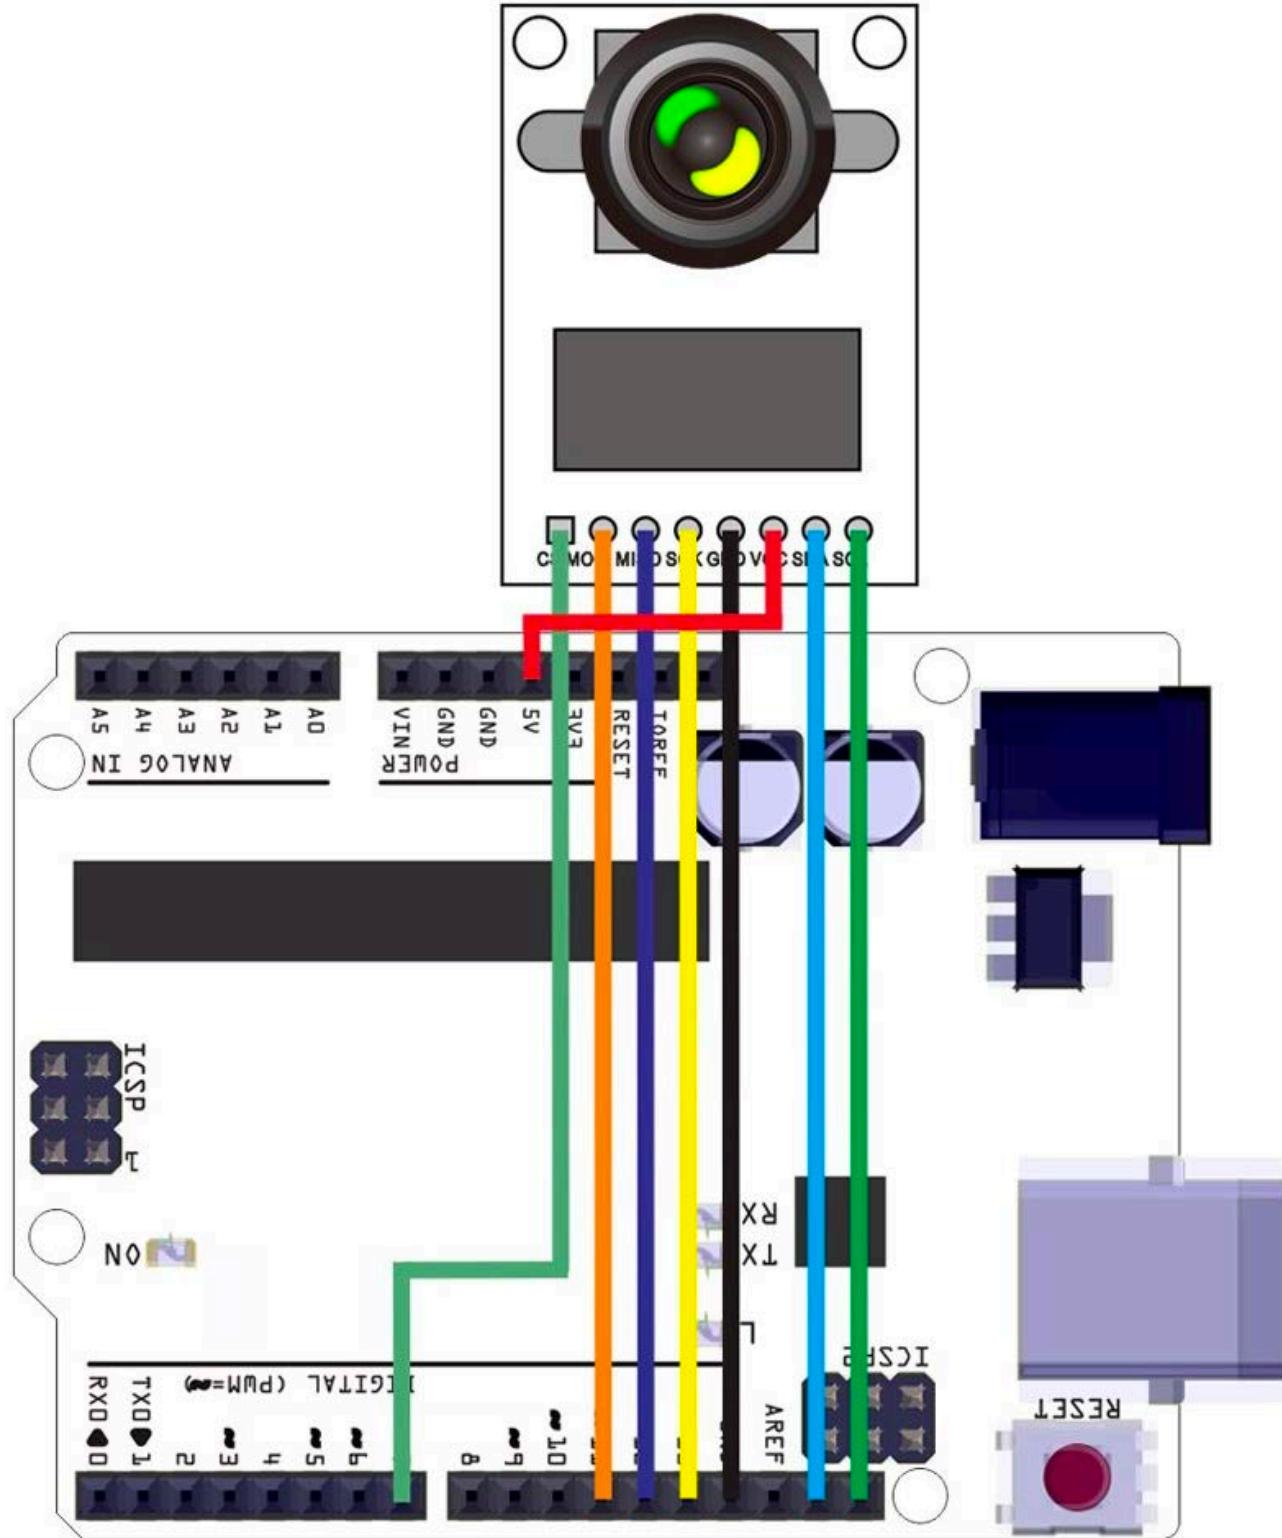

Arducam (SPI and I2C)

I2C IMU (accelerometer, gyroscope, compass)

Arducam
SPI + I2C

I2C Example: DS1307 Real Time Clock Module

- Five pins: VCC/GND, SDA, SCL, SQW
 - SQW is a "square wave," which we won't demonstrate here. The other pins are for I2C
- Battery – keeps the time going when power is off!
- Has 56 bytes of RAM that you can also use!

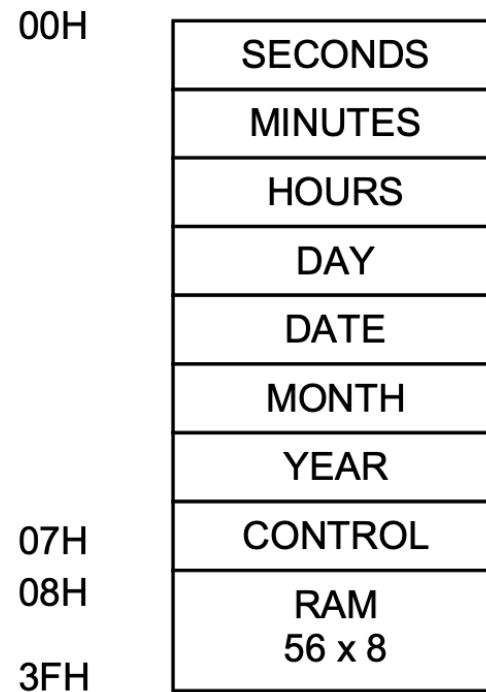

I2C Example: DS1307 Real Time Clock Module

- We need to read the data sheet to figure it out...
- <https://www.sparkfun.com/datasheets/Components/DS1307.pdf>

I2C Example: DS1307 Real Time Clock Module

DS1307 ADDRESS MAP Figure 2

- We send an I2C write with the address we want to read. If we send 0, we can read all 64 bytes

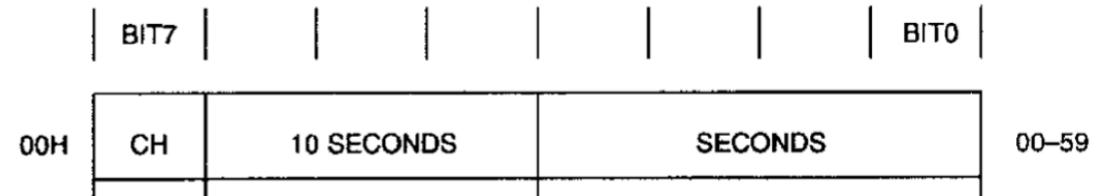

I2C Example: DS1307 Real Time Clock Module

DS1307 TIMEKEEPER REGISTERS Figure 3

- This looks confusing...let's see if we can figure it out (this sometimes takes trial and error!)
- The year is only two digits! (Y2K problem...)
- What would 0b01110011 at address 0 mean?

BIT7 BIT0										
00H	CH	10 SECONDS			SECONDS			00-59		
	0	10 MINUTES			MINUTES			00-59		
	0	12 24	10 HR A/P	10 HR	HOURS			01-12 00-23		
	0	0	0	0	0	DAY		1-7		
	0	0	10 DATE		DATE			01-28/29 01-30 01-31		
	0	0	0	10 MONTH	MONTH			01-12		
	10 YEAR				YEAR			00-99		
	OUT	0	0	SQWE	0	0	RS1	RS0		

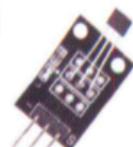

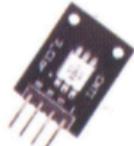

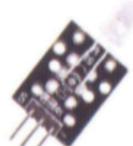

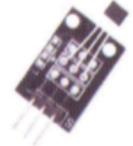

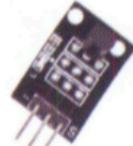

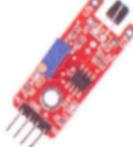

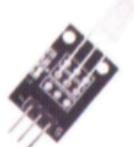

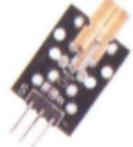

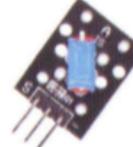

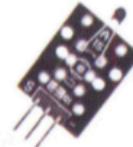

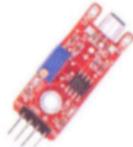

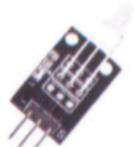

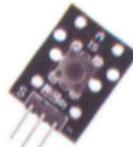

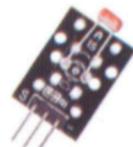

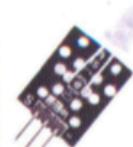

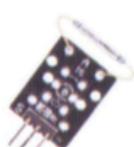

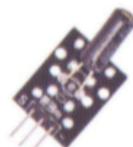

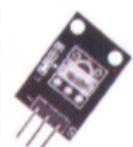

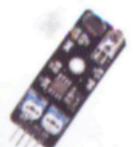

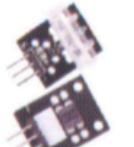

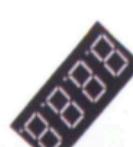

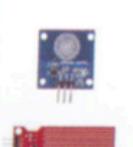

I2C Example: DS1307 Real Time Clock Module

- What would 0b01010011 at address 0 mean?
 - Bit 7: ignore (sets the oscillator on/off). Will be 0 when the oscillator is going (e.g., when it is telling time).
 - Bits 6-4 are the "tens" digit. In this case, 0b101 is 5, or "50"
 - Bits 3-0 are the "ones" digit. In this case, 0b0011 is 3
 - Therefore, the seconds is 53.
 - Why isn't it just the actual numerical 53?
 - Who knows?
 - Possibly because the hex value will actually represent a decimal value...e.g., 0b01010011 = 0x53. Weird.

What other sensors are available?

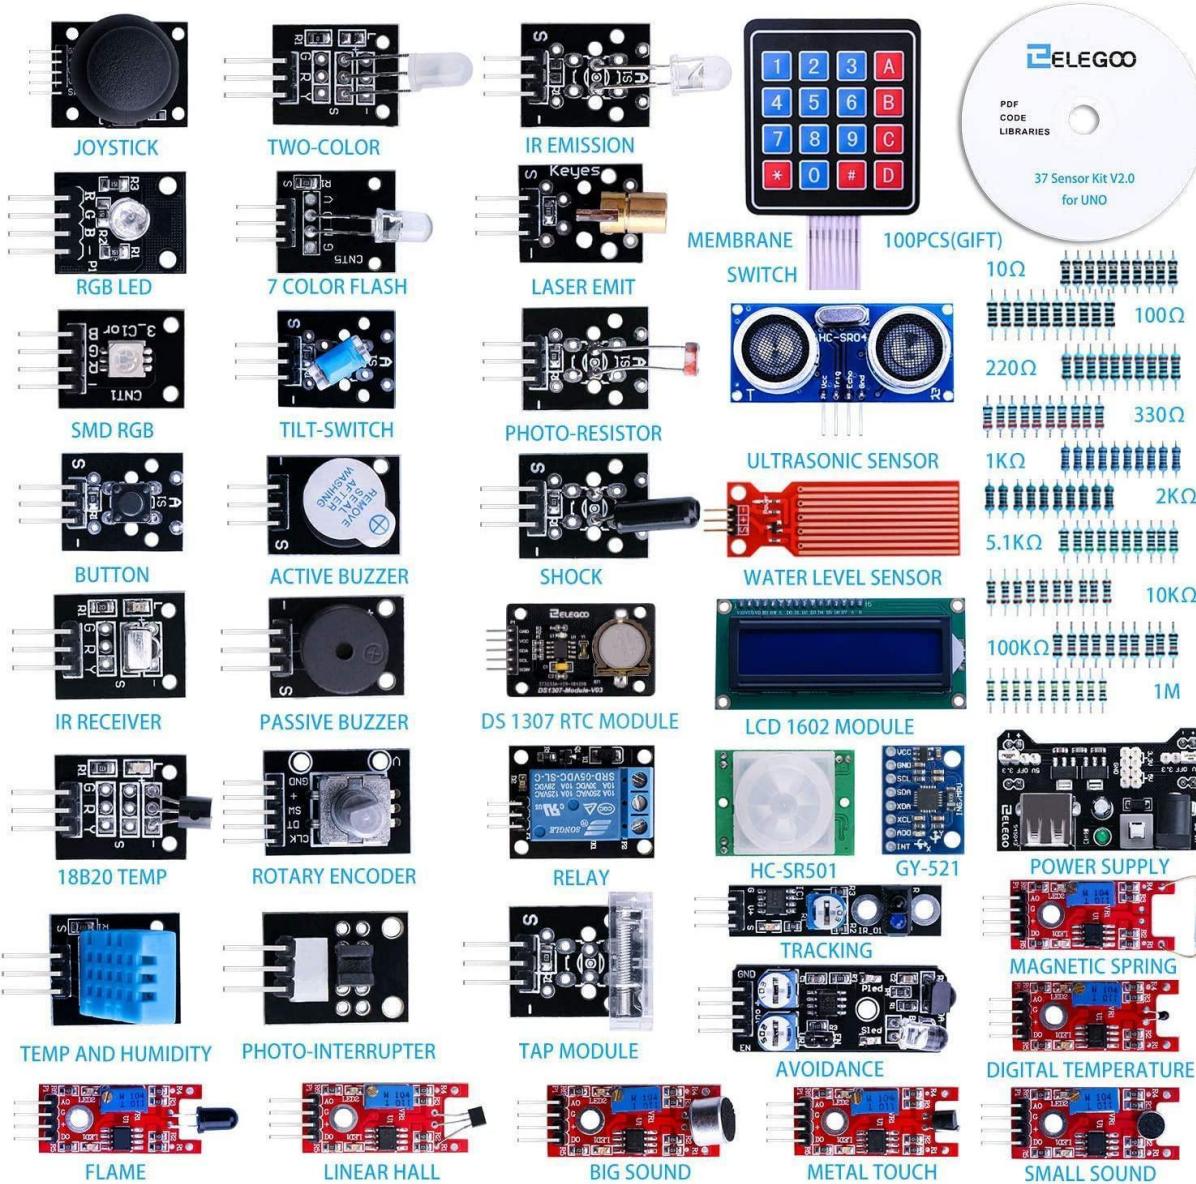

sensor kit

	joystick		Flame		RGB LED		Reed Switch		Rotary encoders		Hall magnetic
	Relay		Linear Hall		SMD RGB		7color flash		Analog Hall		TEMP18B20
	Big sound		Touch		TWO-color LED		Laser emit		Ball switch		Analog temp
	Small sound		Digital temp		Two-color		Button		Photoresistor		IR emission
	Tracking		Buzzer		Mini Reed		Shock		Temp and humidity		IR receiver
	Avoid		Passive Buzzer		Tap module Light blocking		7segment		4 7segment		Touch Water
